PHYS R133: PHYSICS FOR SCIENTISTS AND ENGINEERS 3

Originator jwmiller

College

Oxnard College

Discipline (CB01A) PHYS - Physics

Course Number (CB01B) R133

Course Title (CB02) Physics for Scientists and Engineers 3

Banner/Short Title Science/Engineering Physics 3

Credit Type Credit

Start Term Fall 2021

Catalog Course Description

This course is an introduction to wave motion (with emphasis placed on the study of sound and electromagnetic wave phenomena), geometrical and wave optics, and selected elementary topics on special relativity and quantum mechanics. Central topics include mechanical and electromagnetic waves; geometric optics; interference and diffraction; relativistic kinematics and dynamics; and elementary quantum theory with atomic structure. Although the course emphasizes conceptual understanding, students also learn to apply mathematical techniques such as vector calculus, Fourier analysis, numerical approximations, and multi-variable integration to the solution of problems. The laboratory provides students with opportunities to learn and apply the scientific method through investigations of the phenomena discussed in lecture. The course is appropriate for students majoring in the physical sciences, engineering, mathematics, computer science, and related fields.

Taxonomy of Programs (TOP) Code (CB03)

Prerequisites PHYS R132 and MATH R122

Entrance Skills

Entrance Skills

Students are expected to understand aspects of Calculus used in class to derive expressions and to make connections between graphical analyses and derivatives/integrals. Students are also expected to make use of Calculus throughout the class regarding definitions of quantities and problem solving.

Prerequisite Course Objectives

MATH R122-Evaluate two and three dimensional integrals; and MATH R122-Find the divergence and curl of a vector field; MATH R122-Compute arc length; MATH R122-Write the equation of a tangent plane at a point; MATH R122-Evaluate partial derivatives; MATH R122-Perform vector operations; MATH R122-Perform vector operations MATH R122-Evaluate partial derivatives MATH R122-Evaluate partial derivatives MATH R122-Evaluate partial derivatives MATH R122-Compute arc length

Entrance Skills

Students are expected to have knowledge depicting and solving physical systems by use of diagrams, proper mathematics, and the laws of physics.

Prerequisite Course Objectives

PHYS R132-Draw a diagram or cartoon that clearly and usefully depicts the salient features and characteristics of electromagnetic and thermodynamic systems, and is labeled or annotated so that known and unknown quantities can readily be determined by examination of the diagram and other written information that accompanies it.

PHYS R132-Analyze simple thermodynamic and electromagnetic systems to identify applicable principles (e.g., conservation laws) that may be used to predict the future behavior or evolution of the system.

PHYS R132-Solve conceptual and numerical problems related to the behavior or evolution of a thermodynamic or electromagnetic system by applying those principles identified above.

PHYS R132-Employ appropriate mathematical tools, up to and including vector differentiation and integration, binomial approximations, and linear differential equations, to solve a variety of equations encountered in the study of physics, including geometric/graphical approaches, approximation techniques, and/or numerical methods.

PHYS R132-Argue for or against a scientific hypothesis, supporting his/her conclusions by describing how various physical principles might apply to a novel situation.

PHYS R132-Identify the names and major contributions of notable historical and present-day physicists whose work has expanded humankind's understanding of electromagnetic and thermodynamic systems.

Student Learning	Outcomes	(CSLOs)
------------------	----------	---------

	Upon satisfactory completion of the course, students will be able to:	
1	Students will be able to determine the frequencies corresponding to particular standing waves generated on a fixed string given the parameters of the system.	
2	Student will be able to calculate the angular dispersion of white light passing through a triangular prism.	
3	Students will be able to properly construct a ray diagram and use the information contained to determine the physical properties of the image produced by a lens.	
Course Objectives		

	Upon satisfactory completion of the course, students will be able to:
1	Draw a diagram or cartoon that clearly and usefully depicts the salient features and characteristics of an oscillatory, optical, or relativistic system, or of an atom, and is labeled or annotated so that known and unknown quantities can readily be determined by examination of the diagram and other written information that accompanies it.
2	Analyze a simple oscillatory, optical, or relativistic system to identify applicable principles (e.g., conservation laws) that may be used to predict the future behavior or evolution of the system.
3	Solve conceptual and numerical problems related to the behavior or evolution of an oscillatory, optical, or relativistic system, or of an atom, by applying those principles identified above.

- 4 Employ appropriate mathematical tools, up to and including vector or multivariable differentiation and integration, Fourier analysis, and linear differential equations, to solve a variety of equations encountered in the study of physics, including geometric/graphical approaches, approximation techniques, and/or numerical methods.
- 5 Argue for or against a scientific hypothesis, supporting his/her conclusions by describing how various physical principles might apply to a novel situation.
- 6 Identify the names and major contributions of notable historical and present-day physicists whose work has expanded humankind's understanding of mechanical and optical systems.

Course Content

Lecture/Course Content

Lecture topics:

- 1. Introduction to wave phenomena
 - a. Wave parameters
 - b. Waves in a wire or string (one-dimensional medium)
 - c. Sound waves
 - i. Velocity in a gas
 - ii. Interference
 - iii. Doppler effect
 - d. Electromagnetic waves
 - i. The electromagnetic spectrum
 - ii. Relation to the Maxwell equations
 - iii. Radiation pressure
- 2. Geometrical optics
 - a. Reflection, refraction, and dispersion
 - b. Mirrors and thin lenses
- 3. Optical instruments and Wave optics
 - a. Interference from slits and thin films
 - b. Diffraction and the diffraction grating
 - c. Polarization
- 4. Special relativity
 - a. The postulates, space, and time
 - b. Relativistic kinematics
 - c. Relativistic dynamics and energy, including rest energy
- 5. Quantum physics
 - a. Quantum phenomena
 - i. Photoelectric effect
 - ii. Compton effect
 - iii. The ultraviolet catastrophe and the Planck radiation law for blackbodies
 - iv. Atomic spectra
 - b. The Bohr theory of the atom
 - c. Matter waves
 - i. Wave-particle duality
 - ii. Wave functions for simple one-particle systems
 - iii. Interference of matter waves
 - iv. Barrier tunneling
 - d. The Heisenberg uncertainty principle
 - e. The atomic nucleus, radioactivity, and nuclear models

Laboratory or Activity Content

Labs will include detailed investigations of typical physical systems. Written reports for the labs will include explanations of the theory, the set up, the procedure, data and observations, graphs, and conclusions based on the results.

Laboratory topics include:

- 1. Oscillations and waves
- 2. Standing waves on a string
- 3. Air column resonance: The speed of sound in air
- Fourier synthesis and analysis
- 5. Reflection

- 6. Refraction
- 7. The Dispersion of White Light
- 8. Spherical mirrors and lenses
- 9. Polarized light
- 10. Single and double slit diffraction
- 11. The transmission diffraction grating: Measuring the wavelengths of light
- 12. Line spectra and the Rydberg constant
- 13. Detection of nuclear radiation: The Geiger counter
- 14. Radioactive half-life
- 15. Absorption of nuclear radiation

Methods of Evaluation

Which of these methods will students use to demonstrate proficiency in the subject matter of this course? (Check all that apply):

Problem solving exercises Written expression

Methods of Evaluation may include, but are not limited to, the following typical classroom assessment techniques/required assignments (check as many as are deemed appropriate):

Computational homework Essays Group projects Laboratory activities Laboratory reports Objective exams Problem-Solving Assignments Problem-solving exams Quizzes

Instructional Methodology

Specify the methods of instruction that may be employed in this course

Computer-aided presentations Distance Education Demonstrations Instructor-guided interpretation and analysis Laboratory activities Lecture Small group activities

Describe specific examples of the methods the instructor will use:

- 1. Computer aided presentation: The instructor may employ the computer to aid in the presentation of course materials which would include simulations of specific phenomena such as traveling waves and computerized graphical representations of aspects of a system such as the Doppler Shift.
- 2. Demonstrations: The instructor will demonstrate physical principles by employing equipment and other items such as function generators, oscillators, and lasers. For instance, when studying refraction of light, a laser and a prism may be used to show the change in path of light as well as other phenomena such as dispersion.
- 3. Distance Education (Lecture): When applicable, recordings of lectures will be used to convey subject matter. Also, the use of discussion boards and virtual meetings will be used to allow students to ask questions regarding the course and its material.
- 4. Distance Education (Lab): Laboratory activities, as noted below, will take place in a virtual setting. The experiments will be tailored to utilize computer simulations, prerecorded data acquisition, live online meetings, and message boards where questions can be asked and answered.
- 5. Instructor guided analysis: The instructor will work through physics problems during lecture that investigate a given system in which the students will follow along, answering questions posed by the instructor. This will also serve as a forum for students to ask particular questions regarding the logic and methods employed to come to certain conclusions regarding said problem/ system.
- 6. Laboratory activities: Each week the students will perform a laboratory experiment investigating certain aspects of a system that has been discussed in lecture. These experiments will direct the students such that the intricacies of a given system are explored and compared to theoretical expectations. For instance, in the dispersion lab students will launch direct collimated white light upon a prism and make measurements of the resultant dispersion that take place. Results are then compared to the theory covered in class regarding refraction and dispersion.
- 7. Lecture: The instructor will deliver the course subject matter via in-person lectures to the students. For example, a lecture on Bohr's Model of the Hydrogen Atom.

- 8. Small group activities (Lecture): These may be employed in the form of group quizzes where students work together in small groups to solve some physics problems regarding current material.
- 9. Small group activities (Lab): The students will work in small groups while performing the experiments where applicable.

Representative Course Assignments

Writing Assignments

- 1. Answers to short explanatory (conceptual) questions from the textbook, often assigned from among those at the end of each chapter or posed by the instructor, generally assigned weekly; a typical question might be "In the photoelectric effect, why does the existence of a cutoff frequency speak in favor of the photon theory and against the wave theory?"
- Laboratory reports, including a brief interpretation of experimental results, answers to conceptual questions from the laboratory manual, and/or a conclusion describing how (or whether) the experimental results supported theoretical principles, typically assigned weekly.

Critical Thinking Assignments

1. Answering a wide array of homework, quiz, and exam questions requiring the analysis of a given physical system or circumstance in order to come to the correct conclusion and/or answer regarding the question and/or desired outcome. For instance, a question regarding the Doppler Effect: An object travels toward you while accelerating at a constant rate 7.00 m/s². Starting from rest at a distance of 1000 m from you, it emits a sound with a frequency of 396 Hz. At what distance from you is the object when you hear the sound having a frequency of 441 Hz? Explain the logic used to come to your conclusion.

Reading Assignments

- 1. Regular textbook readings that reinforce the concepts discussed or demonstrated during the class meetings; these readings generally include theory and principles, descriptions of the results of important experiments, data tables, definitions, problem-solving examples, and practical applications of physics in everyday life and in specialized environments.
- 2. Library and other research needed to complete homework problems and/or projects.

Skills Demonstrations

None

Other assignments (if applicable)

None

Outside Assignments

Representative Outside Assignments

- 1. Assigned reading from the textbook typically amounting to one chapter a week. This will amount to 2 hours per week of reading.
- Assigned conceptual and problem solving based homework that further investigates and explores the notions and theories discussed throughout the course. Typically, homework sets will require 6 hours to fully complete and will be due on a weekly basis.
- 3. Studying and preparing for quizzes and exams.

Distance Education Modalities

Hybrid (51%–99% online) Hybrid (1%–50% online) 100% online

Faculty Certifications

Faculty assigned to teach Hybrid or Fully Online sections of this course will receive training in how to satisfy the Federal and state regulations governing regular effective/substantive contact for distance education. The training will include common elements in the district-supported learning management system (LMS), online teaching methods, regular effective/substantive contact, and best practices.

Yes

Faculty assigned to teach Hybrid or Fully Online sections of this course will meet with the EAC Alternate Media Specialist to ensure that the course content meets the required Federal and state accessibility standards for access by students with disabilities. Common areas for discussion include accessibility of PDF files, images, captioning of videos, Power Point presentations, math and scientific notation, and ensuring the use of style mark-up in Word documents. Yes

Regular Effective/Substantive Contact

Hybrid (1%-50% online)	Modality:
------------------------	-----------

Method of Instruction	Document typical activities or assignments for each method of instruction
Other DE (e.g., recorded lectures)	The students will watch recorded lecture videos that go over the pertinent subject matter of the course.
Synchronous Dialog (e.g., online chat)	The students will join live, online meetings in which they will receive instruction, be reminded of all upcoming assignments/events, and be allowed to ask questions pertaining to the lecture and lab material. Recordings will be made available of all live meetings. Students may also be put into small groups to discuss a given class problem.
Asynchronous Dialog (e.g., discussion board)	Students will have access to a discussion board in which they can ask questions regarding the course material.
Face to Face (by student request; cannot be required)	Face to face meetings can be arranged when needed.
Other DE (e.g., recorded lectures)	Recordings of data acquisition and/or simulation use regarding a given lab experiment may be used.
